# BaseBoosted

Ionuț Birescu, Rareș Georgescu

We thought of creating a database suitable for storing data about songs, artists and their albums which can be used by a music providing application. We created the following tables: "Albums", "Artists", "Events", "EventsLinks", "Playlists", "Songs" and "Users". The "Albums" table contains possible information about stored albums. Each Album has linked an artist by an "ArtistId" which is the foreign key between "Albums" and "Artists" table. The "Artists" contains information about possible artists such as their id, their name, their popularity rates, their number of listeners, their status, country origin or their type (whether Solo, Band, DJ). The "EventsLinks" contains a many-to-many relation between the "Events" table and "Artists" table, making the "Events" table more conclusive and without duplicate data. The "Songs" table contains data regarding the Songs' names and their artists and their albums which they appear on. "Users" table contains user-related data, likely including usernames, emails, subscription type or favorite artist.
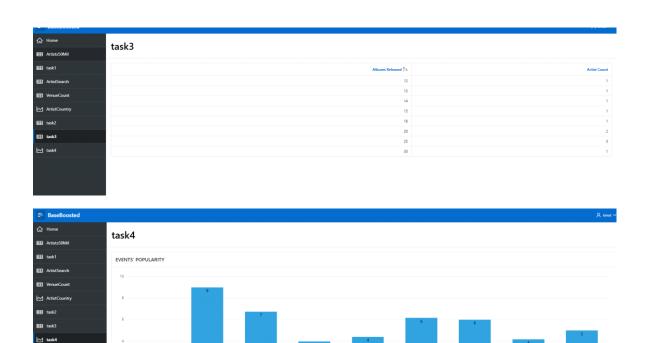

The music database is useful because it can store multiple fields about songs, artists and users and link them to make it a good application for playing music. It stores the necessary data about the users and the music they want to listen to, making the music database well-suited for a music streaming service, enabling features like: Song and album search by artist, type, or popularity, the ability to explore new music and upcoming events based on users' preferences or social and sharing features where users can follow artists or share playlists.

Rares: I created and populated the Artists, Albums, Songs and EventsLinks table. I created 4 pages, 2 classic reports, 1 classic report with data aggregation functions and 1 chart. The pages have different functionalities such as displays all the DJs and Solo artists or displaying informations about the artists' albums number based on criterias.

EVENTS' POPULARITY

Ionut: In this project, I worked on creating the userssongs, playlists, and events tables, along with their data scripts, which were rigorously tested for accuracy. I developed four web pages to enhance the application's functionality: List Certain Artists Page (Artists50Mil), which displays artists with more than a specified number of listeners in descending order; Searching Artists' Songs Page (ArtistSearch), an interactive report displaying all songs of a searched artist; Venue Counter Page (VenueCount), a summary table counting and sorting events by venue; and Number of Artists from Different Countries Page (ArtistCountry), a chart visualizing artist counts by country. Each page was designed to provide meaningful insights and interactivity to users. Additionally, the database scripts were tested thoroughly to ensure schema integrity and data reliability. This work brought together database design and web application development to create a cohesive, functional system.
